Student Cheatsheet v1

Creating a Vector

```clojure
(vector 1 2 3)
;=> [1 2 3]

[1 2 3 4]
;=> [1 2 3 4]
```

Vector Examples

```clojure
(conj [5 10] 15)
;=> [5 10 15]

(count [5 10 15])
;=> 3

(nth [5 10 15] 1)
;=> 10

(first [5 10 15])
;=> 5
```

Defining a value

```clojure
(def name "Sally")
```

Defining a function

```clojure
(defn function-name
  "description of function, optional"
  [param1 param2]
  (function-body))
```

Flow Control

```clojure
(if conditional-expression
  expression-to-evaluate-when-true
  expression-to-evaluate-when-false)
```

Logic Functions

```clojure
(= x 4)
(> x 4)   (>= x 4)
(< x 4)   (<= x 4)
(and x y)
(or x y)
(not x)
```

Creating a Map

```clojure
(hash-map :a 1 :b 2)
;=> {:a 1, :b 2}

{:a 1 :b "two"}
;=> {:a 1, b "two"}
```

Map examples

```clojure
(get {:first "Sally" :last "Brown"} :first)
;=> "Sally"

(get {:first "Sally"} :last :MISS)
;=> :MISS

(assoc {:first "Sally"} :last "Brown")
;=> {:first "Sally", :last "Brown"}

(dissoc {:first "Sally" :last "Brown"} :last)
;=> {:first "Sally"}

(merge {:first "Sally"} {:last "Brown"})
;=> {:first "Sally", :last "Brown"}

(count {:first "Sally" :last "Brown"})
;=> 2

(keys {:first "Sally" :last "Brown"})
;=> (:first :last)

(vals {:first "Sally" :last "Brown"})
;=> ("Sally" "Brown")
```

Let

```clojure
(let [first-name (:first-name user)
      message (str "Hello, " first-name "!")]
  (println message))
```
